

Geochemistry

Lorax geochemists apply tools and principles of geology and chemistry to explain metal leaching (ML) and acid rock drainage (ARD) processes as they are applicable to disturbed landforms, rock and soils. We provide geochemical expertise at each stage of a project, from the conceptualization stage to construction to closure and decommissioning phases.

We provide geochemical services for projects ranging from road alignments to hydroelectric dams to wind farms to major mines. Lorax geochemists work closely with staff scientists and engineers specializing in climate, hydrology, hydrogeology, water quality, aquatic biology and oceanography, to provide innovative, practical and cost-effective solutions to earth sciences problems.
